2024, 2025, and 2026

What the same keys did in each year, and where the value is after that.

Celestia history below is every material message Celenium returns for these addresses, split by year. A message under 1 TIA, a reward claim, and an airdrop multisend are left out of the tables. Ethereum history is the native-ether transaction list from Blockscout. Osmosis public nodes still index only a thin recent window: for the feeder wallets that window is 2026 only, and for the January theft key it is empty. 2024 and 2025 swaps on Osmosis are therefore not relisted transfer by transfer. Balances are the live bank balances. Monero outputs, Tornado Cash withdrawals, and Penumbra shielded spends remain unreadable.

2024

January: the theft key is funded, and the first attempt fails

On 7 January at 20:52 UTC a send of 71,220.031461 TIA from the company key 1083 to celestia1r0ct… failed. The transaction hash is e71bc80e6846024da5a7e0b4ba1004df04179765c876a09857e40ecfad706b5d. Seventy-two seconds later, at 20:53, a send of 71,810.596 TIA succeeded. Hash 14910791f4007f61316e3518e9966f730049d0039c5e7cdd1f5853e777618069. That is the theft. The same public key then signed on Celestia, Osmosis, and the Hub: A/lVF1N4+tI78PVAip+MxVnluWQNaZjtOu7X+M5omoG2.

Date	TIA out	To
12 Jan	810	Itself on Osmosis
24 Jan	7,000	Itself on Osmosis
26 Jan	14,000	Itself on Osmosis
8 Feb	10,000	Itself on Osmosis
7 Jun, 08:29	10,000	Itself on Osmosis
7 Jun, 08:40	30,000.524846	Itself on Osmosis

Six outgoing Celestia transactions, and no seventh. They sum to 71,810.52 TIA. The June pair is the 40,000 TIA the May affidavit still showed on Celestia. After 7 June 2024 this key never spent on Celestia again. 2025 and 2026 on that account are airdrop multisends only.

January: the Ethereum consolidation wallet pays eXch, then goes quiet

0xbC882735bedd79F247D407260C3db8E6f2184159 has thirteen native transactions, all between 12 and 23 January 2024. It received bridged ether and paid it out the same day. There is no 2025 or 2026 transaction. Its balance is zero.

Date	ETH out	To
12 Jan	0.101 and 4.967	eXch deposit 0x9db5… and 0xcC70…
19 Jan	12.162 and 0.175	eXch deposits 0x9145… and 0x98fc…
20 Jan	11.759 and 0.264	0x16c3ae… and 0xaa3b10…, the two extra swaps
23 Jan	23.094, 1.971, 0.282	eXch deposits, and 0.282 ETH to 0x448D…

0xE224… continued that pattern into March 2024: 5 ETH on 8 February, 40 ETH on 15 February, 5 ETH on 25 February, 20 ETH on 27 February, and 30, 30, and 30 ETH on 3 March, all to eXch deposit addresses already in the affidavit. 0x758E… was the other resting wallet. Neither spent the remainder in 2024 except a 5 ETH round-trip on 7 November, from 0xE224 to 0x341987… and back into 0x758E the same day.

All year: the second Celestia key spends the stake down

celestia1h3pnk… had staked 18,058.94 TIA to the Notional validator on 1 November 2023, from two genesis addresses, and moved that stake to another validator on 5 December 2023. Through 2024 it withdrew rewards and sent them on. The large exits were bridges, not payments to the theft key.

2024	TIA	Destination
7 Jan, morning	218.31	Itself on Osmosis, hours before the evening theft
Jan–Jul, many	about 1,560 in smaller bridges and sends	Itself on Osmosis, Stargaze, and a few Celestia addresses
20 Aug	18,342.10	Itself on Osmosis
20 Aug	1,000 and 998	Two Penumbra shielded addresses
1 Sep	1,059.74	Itself on Osmosis

Penumbra is shielded. Those 1,998 TIA are visible as deposits and not after that. Celenium shows no material Celestia send from this key in 2025 or 2026. The Osmosis form of the key, osmo1h3pnk…, has no transaction in the public Osmosis index, so the sale of the bridged TIA is not itemised. The key's live Osmosis balance is 212,339.53 OSMO, and it does not still hold the TIA as TIA.

January and February: the 9,008 TIA stake is held, not spent

celestia1c35… spent almost nothing in 2024. It sent 5.64 TIA on 19 January and 16.55 TIA on 26 January. Around those dates it undelegated 3,000, 3,000, and 3,123.41 TIA from Imperator and cancelled each unbonding, on 19 January and again on 9 February. The fee-grant key celestia1x6h3…, funded that morning with 1.37 TIA by the genesis address celestia10djr…, cancelled an unbonding of the same 9,123.406540 TIA at Imperator seven minutes before 1c35 did. 1c35's stake stayed put through the end of 2024.

The Binance workbook, not the chain index, is the 2024 record of the other cash-out. From 23 December 2023 through 8 April 2024, user 53164342 sold the 152.5 ATOM and later deposits and sent 15,389.81 USDT internally to user 11738338. The last withdrawal in that sheet is 8 April 2024. Osmosis does not still index those 2024 deposits.

2025

January and July: the 9,008 TIA finally leaves, then stops

Date	What moved	Where it went
5 Jan	799.99 TIA	From 1c35 to celestia16q5…
5 Jan	9,123.406540 TIA undelegated	Imperator.co, the stake 1c35 had held since 2023
26 Jan	9,123.38 TIA and 89.98 TIA	From 1c35 to celestia16q5…
20 Jul	10,013.345032 TIA	From 16q5 to celestia1hkqyuh38terdtcvf49kvcs4hv3kpyslm8zrv50

16q5 signed once, that July send, and has not signed again. hkqyuh has never signed. Its sequence is still 0, and it still holds 10,013.35 TIA. 2026 messages on both addresses are airdrops. The theft key 1r0ct also has no Celestia spend in 2025.

May: the Ethereum remainder goes into TornadoRouter

On 5 May, 0xE224… sent 20.394 ETH to 0x4c5fb9046085153d89a19118123facc2ab813e31. On 8 May, 0x758E… sent 127.69 ETH to that same address. The same day, 0x4c5f… paid the ether on in round lots of 0.1, 1, 10, and 100 ETH to 0xd90e2f925DA726b50C4Ed8D0Fb90Ad053324F31b. That contract is verified as TornadoRouter, source file contracts/tornado-proxy/TornadoRouter.sol. Its balance is zero, because a deposit is not a balance held in the sender's name. The withdrawal side is not readable from the deposit. There is no 2026 native transaction on 0xE224…, 0x758E…, or 0xbC882…. 0xE224 holds about 0.0016 ETH. 0x758E holds about 0.104 ETH. 0x4c5f holds about 0.014 ETH.

2025 is otherwise quiet on the keys that can be listed. h3pnkam, 10djr, and the fee-grant key have no material Celestia send in 2025. Osmosis provides no 2025 transactions for 1r0ct, h3pnkam, tp50, or kfzdt. That year on Osmosis is a gap in the public index, not a proof that nothing happened.

2026

On Celestia, 2026 for 1r0ct, 1c35, hkqyuh, 16q5, h3pnkam, the fee-grant key, and 10djr is inbound airdrop multisends. None of them spent. The parked 10,013.35 TIA did not move. The STARS did not need a 2026 transaction to remain: cosmos1r0ct… still holds 218,892.27 of the migrated STARS token. The side wallets are also still where the affidavit left them: 4.248 AKT, 4.009 OSMO, 2.318 OSMO, and 7.772664 USDC.

The only indexed 2026 value movement on Osmosis, among these keys, is the two feeder wallets paying the old Binance deposit address. The node returns 7 outgoing transactions for osmo1tp50… and 16 for osmo1kfzdt…, every one of them dated 2026, and it returns none for 1r0ct or h3pnkam. Six of the feeder transactions are OSMO sends to osmo129uhlqcsvmehxgzcsdxksnsyz94dvea907e575, each with memo 100603137.

2026 date	From	OSMO
8 Jun	kfzdt	4,400
14 Jun	tp50	2,082
19 Jul	kfzdt	4,000
16 Aug	kfzdt	3,000
26 Aug	tp50	669
3 Sep	kfzdt	2,830

That is 16,981 OSMO into the deposit address the May 2024 Binance file assigned to user 53164342. The public index contains no 2024 or 2025 counterpart of these sends, so this table is the 2026 window only. tp50's Osmosis sequence is 327 and kfzdt's is 28, so both keys have signed much more than these six payments. Those other signatures are outside this index. Their public keys are not the 1r0ct key.

After the three years

Still readable	Amount	Since
STARS on cosmos1r0ct…	218,892.27	The January 2024 theft, migrated with the chain
TIA on celestia1hkqyu…	10,013.35, never spent	Parked 20 July 2025
OSMO on osmo1h3pnk…	212,339.53 liquid	Key received 18,342 TIA on 20 Aug 2024; TIA itself is gone
AKT, OSMO, USDC on the two side keys	4.248 AKT, 4.009 OSMO, 2.318 OSMO, 7.772664 USDC	Unmoved since the 2024 affidavit
OSMO into the Binance deposit address	16,981 in the 2026 index	Last indexed send 3 Sep 2026

Not readable, in any of the three years

Monero: the ten payout transactions confirmed in 2024 stay encrypted. TornadoRouter: the May 2025 deposits do not identify a withdrawal. Penumbra: the 20 August 2024 deposits of 1,000 and 998 TIA do not show a later spend. Osmosis: 2024 and 2025 swap history for 1r0ct and h3pnkam is not on the nodes that answered, so the path from those bridges to the ether, and from h3pnkam's TIA to its 212,339 OSMO, is a balance change rather than a list of trades. Stargaze did not answer, so the Bad Kid NFTs are unchecked. The fungible STARS of that key are on the Hub.

Read from Celenium, Blockscout, ethereum.publicnode.com, LavenderFive, and osmosis-rest.publicnode.com. The 2024 Binance cash-out figures are from the user 53164342 workbook, because that year is no longer in the Osmosis tx index. This is a chronology of keys. It is not a finding that a named person holds one.
